

Assignment 9: Bug Trackers*

1 Overview

The purpose of this assignment is to give you some experience with bug trackers, also called issue trackers. Different source code hosting sites provide different issue trackers, and many large projects have their own, custom trackers. There is no standard for what a tracker does. This assignment explores the Bugzilla bug tracker. It is predicated on your having completed the reading from Assignment 7.

2 Details

All of the project details are stated in the `README.md` file in the repository created for you on GitHub. Your repository's name is of the form `GitHub-username-bugtracker-exercise-01`.

3 Due Date

Please complete this by Monday October 22. This due date is only a few days after the one for the preceding assignment, but you can do these two separate assignments simultaneously, and this one is not much work. I estimate no more than two hours total.
